

Week 5 Quiz

This ungraded Week 5 quiz is intended as a hands-on-lab to help you build your skills writing R functions. Solutions to all problems are immediately available, but you'll learn the material more *durably* if you attempt each problem before consulting its solution.

Write two functions. These functions should take a numeric vector as input, and determine the mean and the median from the values in the vector. Please do not use the built-in `mean()` or `median()` functions. You should also provide some code that initializes your numeric vector and calls your two functions!
